N'Alternate names: alpha-2-thiol proteinase inhibitor; preprokininogen;
N'Contains: bradykinin (kallidin I); HMW kininogen I; HMW kininogen II;
R;Kitamura, N.; Kitagawa, H.; Fukushima, D.; Takagaki, Y.; Miyata, T.; J. Biol. Chem. 280, 8610-8617, 1985
A;Title: Structural organization of the human kininogen gene and a mode

Proc. 27, 52-57, 1968
A;Title: Structural features of plasma kinins and kininogens.
A;Reference number: A91455, MUID:90255622
A;Comment: The HWW kininogen precursor and the LMW form are produced from the same gene C;Comment: Kininogen is a cysteline proteinase inhibitor, takes part in initiation of the C;Comment: The glycine/histidine/lysine-rich region of HMW kininogen light chain is impo C;Comment: The glycine/histidine/lysine-rich region of HMW kininogen light chain is impo C;Comment: Bradykinin, released from kininogen by kallikrein, is a potent vasodilator, in xyproline residue is present in the kininogen prior to the release of bradykinin.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 A; Molecule type: protein

Genome 7:509-517(1996).

-! FUNCTION: PLAKS A CRITICAL ROLE IN BOTH CONSTITUTIVE AND ENHANCER-DEPENDENT SPLICING BY MEDIATING ESSENTIAL PROTEIN-PROTEIN INTERACTIONS AND PROTEIN-RNA INTERACTIONS REQUIRED FOR ACCURATE 3' SPLICE SITE SELECTION. DIRECTLY MEDIATES INTERACTIONS BETWEEN UZAF65 (LARGE SUBUNIT) AND PROTEINS BOUND TO THE ENHANCERS AND THUS MAY FUNCTION AS A BRIDGE BETWEEN UZAF65 AND THE SHHANCER COMPLEX TO RECRUIT IT TO THE ADJACENT INTRON (BY SIMILARITY).
-! SUBUNIT: ASSOCIATES WITH A 65 kDa PROTEIN.
-! SUBCELLULAR LOCATION: NUCLEAR.
-! SUBCELLULAR LOCATION: NUCLEAR.
-! SIMILARITY: CONTAINS IN RECOGNITION MOTIF (RRM).
                                                                                                                                                                                                                                                                                                               Gaps

"Genome sequence of the endocellular bacterial symbiont of aphids
Buchnera sp. Aps."

Nature 407:81-86(2000).

-I-FUNCTION: CATALYZES AN AMIDOTRANSFERASE REACTION THAT GENERATES
IMDAZOLE-GIVEEROL PHOSPHATE AND S-AMINOIMIDAZOL-4-CARBOXAMIDE
RIBONUCLEOTIDE, WHICH IS USED FOR PURINE SYMTHESIS.

-I-PATHWAY: FIFTH STEP IN HISTIDINE BIOSYNTHETIC PATHWAY.

-I-SOMCELLULAR LOCATION: CYLOPIASMIC (PRODABLE).

-I-SIMILARITY: BELONGS TO THE HISH FAMILY.

-I-SIMILARITY: CONTAINS 1 TYPE-1 GLUTAMINE AMIDOTRANSFERASE DOMAIN.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps

The splicing factor U2AF35 mediates critical protein-protein are splicing factor U2AF35 mediates critical protein-protein are splicing factor U2AF35 mediates critical protein-protein interactions in constitutive and enhancer-dependent splicing.";

AL Genes Dev. 10:1356-1368(1996).

CI FUNCTION: PLAKS A CRITICAL ROLE IN BOTH CONSTITUTIVE AND ENHANCER-DEPENDENT SPLICING BY MEDIATING ESSENTIAL PROTEIN-PROTEIN AND FORTEN-PROTEIN PROTEIN-PROTEIN FOR ACCUBATE 3' SPLICE SITE SELECTION. DIRECTLY MEDIATES INTERACTIONS BETWEEN U2AF65 (LARGE SUBGURIT), AND PROTEINS BOUND TO THE ENHANCER AND THUS MAY FUNCTION AS A BRIDGE BETWEEN U2AF65 AND THE ENHANCER COMPLEX TO RECRUIT IT TO THE ADJACENT INTRON.

CISCUMPLEX TO RECRUIT IT TO THE ADJACENT INTRON.

CISCUMPLEX TO RECRUIT IT A 65 KDB PROTEIN.

CISCUMPLEX TO RECRUIT IN A 65 KDB PROTEIN.

CISCUMPLEX AND THE CARBOXY-TERMINAL DOMAIN IS REQUIRED FOR FORMATION OF TRAZ, AND THE CARBOXY-TERMINAL DOMAIN IS REQUIRED FOR FORMATION OF TRAZ, AND THE CARBOXY-TERMINAL DOMAIN IS REQUIRED FOR FORMATION OF TRAZ, AND THE CARBOXY-TERMINAL DOMAIN IS REQUIRED FOR FORMATION OF TRAZ INTRATIY: CONTAINS 1 RNA RECOGNITION WOTIF (RRM).

CI-SIMILARITY: BELONGS TO THE ST FAMILY OF SPLICING FACTORS.
                                                                                                                                                                                                                                                                                        This SWISS-PROT entry is copyright. The present invention relates to inhibition of the enzymatic activity of legumain or a legumain-related endopeptidase by cystatin. The inhibition involves an interaction between legumain and a papain-non-reactive site of cystatin. Legumain (EC 3.4.22.34) is a cysteine endopeptidase, and performs a protein-processing function. The present sequence is a peptide fragment of human kininogen D3, which was used in the present invention. Kininogen is a type 3 cystatin. The present sequence is thought to be involved in a legumain-inhibitory site.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Composition for inhibiting angiogenesis and endothelial cell proliferation, inducing endothelial cell apoptosis and treating cancer, rheumatoid arthritis, and ocular disorders comprises a kininogen domain

                            The present sequence is that of a D3 peptide derived from high mol.wt. kininogen (HK) domain 3 (see AAY95426). The D3 peptide, which may optionally include N-terminal and/or C-terminal protecting groups, inhibits endothelial cell proliferation and thus possesses anti-angiogenic activity. It is an example of peptides of the invention (see AAY95405-26) which are analogues of certain sites in the HK obmain 3, in this case amino acids Asn275-Lys282. The peptides inhibit endothelial cell proliferation and may also induce endothelial cell apoptosis. Compositions including such peptides are used in claimed methods for inhibiting anglogenesis, inhibiting endothelial cell proliferation, and inducing endothelial cell poptosis. Cancer, rheumatodia arthritis, and ocular disorders characterized by undesired vascularization of the retina are treated.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Composition for inhibiting angiogenesis and endothelial cell proliferation, inducing endothelial cell apoptosis and treating cancer, rheumatoid arthritis, and ocular disorders comprises a kininogen domain
                                                                                                                                                                                                                                                                                                                                                                              Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The present sequence is that of a D3 peptide derived from human high mol.wt. kininogen (HK) domain 3 (see AAY95426). Composition for inhibiting angiogenesis and endothelial cell proliferation, inducing endothelial cell apoptosis and treating cancer, rheumatoid arthritis, and ocular disorders comprises a kininogen domain
The peptides inhibit endothelial cell proliferation and may also induce endothelial cell apoptosis. Compositions including the peptides are used in claimed methods for inhibiting angiogenesis, inhibiting endothelial cell proliferation, and inducing endothelial cell proliferation, and inducing endothelial cell apoptosis. Cancer, rheumatoid arthritis, and ocular disorders characterized by undesired vascularization of the retina are treated. The ICSO value for the present peptide was less than 0.8 um for inhibition of fibroblast growth factor-induced HUVEC cell
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The present sequence is that of a D3 peptide derived from human high mol.wt. kininogen (HK) domain 3 (see AAY95426). The D3 peptide inhibits endothelial cell proliferation and thus possessess anti-anglogenic activity. It is an example of D3 peptides of the invention (see AAY95405-26) that are analogues of certain sites in the HK domain 3, in this case amino acid residues ASAD75-Lys282. The peptides inhibit endothelial cell proliferation and may also induce endothelial cell apoptosis. Compositions including the peptides are used in claimed methods for inhibiting anglogenesis, inhibiting endothelial cell proliferation, and inducing endothelial cell apoptosis. Cancer, rheumatoid arthritis, and ocular disorders cell apoptosis. Cancer, rheumatoid arthritis, and ocular disorders characterized by undesired vascularization of the retina are treated.
                                                                                                                                                                                                                                                                                              Gaps

Composition for inhibiting angiogenesis and endothelial cell proliferation, inducing endothelial cell apoptosis and treating cancer, rheumatoid arthritis, and ocular disorders comprises a kininogen domain
                                                                                                                                               Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The present sequence is that of a D3 peptide derived from human high mol.wt. kininogen (HK) domain 3 (see AAV95426). The D3 peptide inhibits endothelial cell proliferation and thus possesses anti-anglogenic activity. It is an example of D3 peptides of the invention (see AAV95405-26) that are analogues of certain sites in the Case and Case and Case action sites in the peptides and cell proliferation and may also induce endothelial cell apoptosis. Compositions including the peptides in claimed methods for inhibiting anglogenesis, inhibiting endothelial cell proliferation, and inducing endothelial cell proliferation, and inducing endothelial cell apoptosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            characterized by undesired vascularization of the retina are treated
                                                                                                                                                                                                                                                                                                                                                                                                      Anti-angiogenic; anglogenesis; inhibitor; kininogen; homologue; endothelial cell proliferation; apoptosis; cancer; ocular disorder; rheumatoid arthritis; cytotatic; antiarthritic; antirheumatic; therapy; human; D3 peptide.
The IC50 value for the present peptide was less than 0.8 uM for inhibition of fibroblast growth factor-induced HUVEC cell proliferation.

The present invention relates to inhibition of the enzymatic activity of legumain or a legumain related endopeptidase by cystatin. The inhibition involves an interaction between legumain and a papain-non-reactive site of cystatin. Legumain (EC 3.4.23.44) is a cysteine endopeptidase, and performs a protein-processing function. The present sequence is human kininogen D3, which was used in the present invention. Kininogen is a

Domain 3 was isolated from low molecular weight kininogen, derived from human plasma. by cleavage with trypsin. Domain 3 peptide inhibits platelet activation causing a marked decrease in the platelets ability to aggregate and secrete their granule contents. The granule contents comprise proteins which participate in hemostasis, thrombosis and the inflammatory response. Domain 3 also inhibits endothelial cell activation shown by a decrease in secretion of endothelial cell contents such as tissue plasminogen activator and won Willebrand factor. Domain 3 functions to inhibit cell activation by blocking thrombin binding to its target cells, the peptide is a selective inhibitor of thrombin-induced platlet.
                                                                                                                                                                                                                                                                                                    Domain 3; human; kininogen; heavy chain; low molecular weight; plasma; trypsin; platelet; activation; granule contents; hemostasis; thrombin; tissue plasminogen activator; thrombosis; inflammatory response; endothelial cell; von Willebrand factor;

The invention relates to isolated polynucleotide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes, polymerase chain reaction (PCR) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The polynucleotides are also used in diagnostics as expressed sequence tags for identifying expressed genes. (I) is useful in gene therapy techniques to restore normal activity of (II) or to treat disease states involving quantitating a polypeptide in tissue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful in medical imaging of sites expressing (II). (I) and (II) are useful for treating disorders involving aberrant protein expression or biological activity. The polypeptide and polynucleotide sequences have applications in diagnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits to assess biodiversity and to produce other types of data and products dependent on DNA and amino acid sequences. ABG00010-ABG30377 represent novel human diagnostic amino acid sequences of the invention.

Note: The sequence data for this patent did not appear in the printed specification, but was obtained in electronic format directly from WIPO. At the wipo.int, pub/published_pct_sequences.

                                                                                                                                                                                                                                                                                                                                          Composition for inhibiting angiogenesis and endothelial cell proliferation, inducing endothelial cell apoptosis and treating cancer, rheumatoid arthritis, and ocular disorders comprises a kininogen domain
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The present sequence is that of domain 3 of human high mol.wt. kininogen (HK). The invention provides peptides (see AAY95405-24) that are analogues of certain sites in the HK domain 3, specifically Asn275-Lys282, Cys246-Cys249, Leu331-Tyr338 and Tyr299-Ser314. The peptides, in which native Cys residues may be replaced by A har residues, inhibit endothelial cell proliferation and may also induce endothelial cell apoptosis. Compositions including the peptides are used in claimed methods for inhibiting angiogenesis, inhibiting endothelial cell proliferation, and inducing endothelial cell apoptosis. Cancer, rheumatoid arthritis, and ocular disorders characterized by undesired vascularization of the retina are treated.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Human; chromosome mapping; gene mapping; gene therapy; forensic; food supplement; medical imaging; diagnostic; genetic disorder.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The invention relates to isolated polynucleotide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes, polymerase chain reaction (PRR) primers, oligomer, and for chromosome and gene mapping, and in recombinant production of (II). The polynucleotides are also used in diagnostics as expressed sequence tags for identifying expressed genes. (I) is useful in gene therapy techniques to restore normal activity of (II) or to tread disease states involving quantitating a polypeptide in tissue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful in medical imaging of sites expressing (II). (I) and (II) are useful in medical imaging of sites expressing (II). (I) and (II) are useful for treating disorders involving aberrant protein expression or biological activity. The polypeptide and polynucleotide sequences have applications in diagnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits to assess biodiversity and to produce other types of data and products dependent on DNA and amino acid sequences. ABG00010-ABG30377 represent novel human and amino acid sequences of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ö
                                                                                                                                                                                                                                                                                                                                                                                 Note: The sequence data for this patent did not appear in the printed specification, but was obtained in electronic format directly from WIPO
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Gaps
                                                            New isolated polynucleotide and encoded polypeptides, useful in haldgrostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits and to assess biodiversity

The invention relates to isolated polynucleotide (I) and probes, colympeptide (II) sequences. (I) is useful as hybridisation probes, polymerase chain reaction (PCR) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The colynucleotides are also used in diagnostics as expressed sequence tags for identifying expressed genes. (I) is useful in gene therapy techniques to restore normal activity of (II) or to treat disease states involving to restore normal activity of (II) or to treat disease states involving a polypeptide in tissue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful in medical imaging of sites expressing (II). (I) and (II) are useful for treating disorders involving aberrant protein expression or biological activity. The polypeptide and polynucleotide sequences have applications in diagnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits to assess biodiversity and to produce other types of data and products dependent on DNA and canno acid sequences. ABGO0010-ABG30377 represent novel human DNA and diagnostic amino acid sequences of the invention.

Specification, but was obtained in electronic format directly from WIPO

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The invention relates to human polynucleotides (AAI79941-AAI93841) and the encoded proteins (AA000010-AA013910) that exhibit activity elating to cytokine, cell proliferation or cell differentiation or which may induce production of other cytokines in other cell populations. The polynucleotides and polypeptides are useful in gene therapy, vaccines or peptide therapy. The polypeptides have various cytokine-like activities, e.g. stem cell growth factor activity, immunomodulatory activity and activity tissue growth factor activity, immunomodulatory activity and activin/inhibin activity and may be useful in the diagnosis and/or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Human; cytokine; cell proliferation; cell differentiation; gene therapy; vacchie; peptide therapy; stem cell growth factor; haematopolesis; tissue growth factor; immunomodulatory; cancer; leukaemia; nervous system disorders; arthritis; inflammation.
                                                                                                Administration of a peptide or multimer related to bradykinin or other disclosed peptides and multimers can be used for the inhibition of thrombin-induced platelets or other cells. They can also be used for preventing platelet aggregation, or inhibiting ADP-induced activation. This is useful to prevent arterial occlusions arising from coronary thrombosis and stroke.
                                                                                                                                                                                                                                                                                                        Gaps
              Inhibition of platelet activation and aggregation - by admin. of new
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Isolated nucleic acids and polypeptides, useful for preventing diagnosing and treating e.g. leukaemia, inflammation and immune disorders -

The colon cancer antigens have cytostatic activity and can be used in gene therapy and vacchee production. N and P may be used in the prevention, diagnosis and treatment of diseases associated with inappropriate P expression. For example, N and P may be used to treat disorders associated with decreased expression by rectifying mutations or deletions in a patient's genome that affect the activity of P by expressing inactive proteins or to supplement the patients own production of P. Additionally. N may be used to produce the colon cancer associated Ps, by inserting the nucleic acids into a host cell and culturing the cell or express the proteins. N and P can be used in the prevention, diagnosis and treatment of colorectal carcinomas and cancers. AAH37196 to AAH37204 and AAB77789 represent sequences used in the exemplification of the

The present sequence is a microbial beta-glucuronidase (GUS)

protein. GUS genes were obtained from six different genera:

Enterobacter/Salmonella, pseudomonas, Salmonella, Staphylococcus and
Thermotoga. Microbial GUS can be used as a reporter/effector molecule for
transgenic constructions and in in vitro diagnostic applications. It may
also be used to generate sentinel plants that serve as bioindicators of
environmental status. It may be used to generate transgenic insects for
bioassay for compounds that affect molecules critical for insect
development (e.g. juvenile hormone). Secreted GUS may also serve as a
marker for beneficial fungi destined for release into the environment.

Comparains, secreted GUS may be used to achieve extracellular
animal systems, secreted GUS may be used to achieve extracellular
conjugation patterns of glucuronides. Microbial GUS may also be used in
traditional medical adiagnostic assays, for drug testing, pharmacokinetic
studies, bloavallability studies, diagnosis of diseases and syndromes,
following progression of disease or its response to therapy. Microbial
activity. It is highly specific for the substrate and water soluble, and
the substrates are stable.
                                                                                                   ő

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    --- FUNCTION: (1) KININGGENS ARE INHIBITORS OF THIOL PROTEASES; (2)
HMW-KININGGEN PLAYS AN IMPORTANT ROLE IN BLOOD COAGULATION BY
HELPING TO POSITION OPTIMALLY PREKALLIKREIN AND FACTOR XI NEXT TO
FACTOR XIL; (3) HMW-KININGEN INHIBITS THE THROMEIN-AND PLASMIN-
INDUCED AGGREGATION OF THROMBOCYTES; (4) THE ACTIVE PEPTIDE
BRADYKININ THAT IS RELEASED FROM HWW-KININGEN SHOWS A VARIETY OF
PHYSIOLOGICAL EFFECTS: (4A) INFLUENCE IN SMOOTH MUSCLE
CONTRACTION, (4B) INDUCTION OF HYPOTENSION, (4C) NATRICRESIS AND
DIURESIS, (4D) DECREASE IN BLOOD GLUCOSE LEVEL, (4E) IT IS A
MEDIATOR OF INFLAMMATION AND CAUSES (4E1) INFREASE IN VASCULAR
PERMEABILITY, (4E2) STIMULIATION OF NOCICEPTORS (4E3) RELEASE OF
OTHER MEDIATORS OF INFLAMMATION (E.G. PROSTAGLANDINS), (4F) IT HAS
A CARDIOPROTECTIVE EFFECT (DIRECTLY VIA BRADYKININ ACTION,
INDIRECTLY VIA ENDOTHELIUM-DERIVED RELAXING FACTOR ACTION); (5)
LWW-KININGEN INHIBITS THE AGSREGATION OF THROMBOCYTES; (6) LAW-
KININGEN IS IN CONTRAST TO HMW-KININGEN NOT INVOLVED IN BLOOD
                                                                                                                                                                                                                                                                                        This SWISS-PROT entry is copyright. AECULENCE analysis of the complete Caenorhabditis elegans myosin heavy chain gene family.";

The act of the sequence analysis of the complete Caenorhabditis elegans myosin heavy chain gene family.";

The act of the sequence analysis of the contraction.

THE AND LEGGE CONTRACTION.

THE SUBURT: MUSCLE CONTRACTION.

THE SUBURT: CALLOLAR LOCATION: Thick filaments of the myoribrils.

THE SUBURT: THE ROBLIKE TAIL SEQUENCE IS HIGHLY REPETITIVE. SHOWING CYCLES OF A 28-RESTIONE REPEAT PATTERN COMPOSED OF 4 HEPTAPEPTIDES.

CHOLES OF A 28-RESTIONE REPEAT PATTERN COMPOSED OF 4 HEPTAPEPTIDES.

CHARLATED AND ARE REQUIRED FOR MYOSIN ATPASE ACTIVITY.

ALKYLARED AND ARE REQUIRED FOR MYOSIN ATPASE ACTIVITY.

MEROMYOSIN (LAMA) AND 1 HEAVY MEROMYOSIN (HAM). IT CAN LAFER BE SELICE TRUE.

SPLIT PURTHER INTO 2 GLOBULAR SUBFRAGMENTS (S1) AND 1 ROD-SHAPED.
                                                                                                                  Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        -!- MISCELLANEOUS: MHC A AND MHC B ARE FOUND EXCLUSIVELY IN THE BODY WALL MUSCLE. THEY CO-ASSEMBLE INTO BODY WALL THICK FILAMENT.
-!- SIMILARITY: CONTAINS 1 MYOSIN-LIKE GLOBULAR HEAD DOMAIN.
-!- SIMILARITY: CONTAINS 1 1Q DOMAIN.

-I- FUNCTION: INDUCES THE COLLAPSE AND PARALYSIS OF NEURONAL GROWTH CONES. COULD POPERATIALLY ACT AS REPULSIVE CUES TOWARD SPECIFIC NEURONAL POPULATIONS. BINDS TO NEUROPILIN.

-I- SUBCELLULAR LOCATION: Secreted.

-I- TISSUE SPECIFICITY: DEVELOPING SPINAL CORD AND DEVELOPING VISUAL SYSTEM. COLLAPSIN-1, -2, -3, AND -5 BIND TO OVERLAPPING BUT DISTINCT AXON TRACTS.

-I- DOMAIN: STRONG BINDING TO NEUROPILIN IS MEDIATED BY THE CARBOXY THIRD OF THE PROTEIN.
